<b>Description</b>		
<b>Supportanfrage</b>		
<p>class adtf_file::Reader in adtf_file_reader.h does not provide any method to get the current position of reader. (ie., no method equivalent to GetCurrentBlockPos() in adtf streaming library). It would be nice if this is supported directly by adtf_file::Reader class.</p> <p>Is there any way to get the information?</p> <p>Does adtf file library improves performance of random reading (through seekTo() method) compared with Seek method() of adtf streaming library for adtf2 files?</p>		
<b>Lösung</b>		
<p>no, there is currently no possibility to retrieve the current position. I've create a ticket for it: CDIFHD-70.</p> <p>Although the performance of adtf_file has greatly improved to the ADTF Streaming Library, random seeking will not be much faster, as this always requires a lookup via the chunk index table to jump to the nearest indexed chunk and then a search to the actual requested block.</p>

Hi,

no, there is currently no possibility to retrieve the current position. I've create a ticket for it: CDIFHD-70.

Although the performance of adtf\_file has greatly improved to the ADTF Streaming Library, random seeking will not be much faster, as this always requires a lookup via the chunk index table to jump to the nearest indexed chunk and then a search to the actual requested block.

Regards,

Martin
